Tom Street Drainage | Homeowner Brief (Reconciled draft)

Date: October 15, 2026 | **Scope:** 2264 and 2268 Tom Street, Navarre, Santa Rosa County, Florida, and the associated roadside drainage.

Why we are requesting a review

Nearby homeowners seek the approved drainage plans and a coordinated County engineering review of the roadside swale, proposed driveway/pipe works, and any impacts on established properties. We are not alleging a code violation or asserting that construction caused flooding. The question needs actual plans and site measurements, not assumptions.

What the captured records establish

The Santa Rosa County Property Appraiser records identify Holiday Builders Inc. as owner of record of **2264 Tom Street (parcel 21-2S-26-0780-0QQ00-1020)** and **2268 Tom Street (parcel 21-2S-26-0780-0QQ00-1490)**. Archived MGO permit records associate 2264 with **BP-2026-1621**, and 2268 with **BP-2026-1612**; both show **Active** in the saved October 2026 extracts. Current live status has not been independently refreshed for this draft.

MGO's **August 6, 2026** driveway consultation for 2264 directs proposed 12-inch pipe/inlet work and mentions existing structures by the 2260 and 2270 street addresses. This **does not** establish exact pipe alignment, completed installation, adequate capacity, easement rights, or whether structures sit in private property or right-of-way.

MGO's **August 31, 2026** site inspection for 2268 mentions keeping the roadway and stormwater ditch free of sediment. Its **September 10** driveway consultation says to match existing roadway grades. These comments give **no numeric survey elevations, freeboard, storm design event, or outfall capacity**.

Both permit task lists show **“Certified Drainage as Built” as Assigned**. This identifies a workflow item only: it is not evidence that an engineer's certification was required immediately, submitted, missing, rejected, or overdue. The customer portal returned no plan attachments for either permit, which is not proof the County lacks plans.

What is missing

The approved initial and revised grading/site plans, the basis for each permit's grading/ERP pathway, historical and present surveys, actual invert and positive outfall elevations, shared ROW/ditch design and maintenance documents, recorded legal instruments, and any final certified grading/as-built records. Resident photographs in separate project materials require original-file, date, and sharing-permission reconciliation before inclusion as numbered exhibits.

What we request

1. Provide the complete approved and revised plan/permit files for both lots, including engineering review conditions and the engineer of record.
2. Confirm whether a subdivision lot-grading plan was on file for these parcels and which version of County requirements governed the approvals.
3. Identify surveyed driveway/culvert/ditch inverts, positive outfalls and the responsible party for construction and maintenance.

4. Conduct a documented site inspection and written engineering review of potential off-site drainage effects, considering alternative explanations such as antecedent rainfall, existing road/swale condition and blockages.
5. Provide a contact, tracking/reference number, anticipated document production stages, and a written findings/follow-up schedule.

The objective is a measured, documented answer, not a presumption of fault.
