Tom Street Drainage | Homeowner Brief (Reconciled draft)

Date: October 15, 2026 | **Scope:** 2264 and 2268 Tom Street, Navarre, Santa Rosa County, Florida, and the associated roadside drainage.

Why we are requesting a review

Nearby homeowners seek the approved drainage plans and a coordinated County engineering review of the roadside swale, proposed driveway/pipe works, and any impacts on established properties. We are not alleging a code violation or asserting that construction caused flooding. The question needs actual plans and site measurements, not assumptions.

What the captured records establish

The Santa Rosa County Property Appraiser records identify Holiday Builders Inc. as owner of record of **2264 Tom Street (parcel 21-2S-26-0780-0QQ00-1020)** and **2268 Tom Street (parcel 21-2S-26-0780-0QQ00-1490)**. Archived MGO permit records associate 2264 with **BP-2026-1621**, and 2268 with **BP-2026-1612**; both show **Active** in the saved October 2026 extracts. Current live status has not been independently refreshed for this draft.

MGO's **August 6, 2026** driveway consultation for 2264 directs proposed 12-inch pipe/inlet work and mentions existing structures by the 2260 and 2270 street addresses. This **does not** establish exact pipe alignment, completed installation, adequate capacity, easement rights, or whether structures sit in private property or right-of-way.

MGO's **August 31, 2026** site inspection for 2268 mentions keeping the roadway and stormwater ditch free of sediment. Its **September 10** driveway consultation says to match existing roadway grades. These comments give **no numeric survey elevations, freeboard, storm design event, or outfall capacity**.

Both permit task lists show **“Certified Drainage as Built” as Assigned**. This identifies a workflow item only: it is not evidence that an engineer's certification was required immediately, submitted, missing, rejected, or overdue. The customer portal returned no plan attachments for either permit, which is not proof the County lacks plans.

What is missing

The approved initial and revised grading/site plans, the basis for each permit's grading/ERP pathway, historical and present surveys, actual invert and positive outfall elevations, shared ROW/ditch design and maintenance documents, recorded legal instruments, and any final certified grading/as-built records. Resident photographs in separate project materials require original-file, date, and sharing-permission reconciliation before inclusion as numbered exhibits.

What we request

1. Provide the complete approved and revised plan/permit files for both lots, including engineering review conditions and the engineer of record.
2. Confirm whether a subdivision lot-grading plan was on file for these parcels and which version of County requirements governed the approvals.
3. Identify surveyed driveway/culvert/ditch inverts, positive outfalls and the responsible party for construction and maintenance.

4. Conduct a documented site inspection and written engineering review of potential off-site drainage effects, considering alternative explanations such as antecedent rainfall, existing road/swale condition and blockages.
5. Provide a contact, tracking/reference number, anticipated document production stages, and a written findings/follow-up schedule.

The objective is a measured, documented answer, not a presumption of fault.

Source pointers: `02_PROPERTY_AND_PARCELS/` official exports; `03_PERMITS_AND_INSPECTIONS/` captured MGO files; `04_ENGINEERING_AND_DRAINAGE/` archived related-inspection records; `00_CONTROL/REGULATORY_AND_CASELAW_MATRIX.md`. All interpretations are limited by the date and scope of the saved sources.

Draft homeowner correspondence: Tom Street drainage and records

Date: _____

To: Santa Rosa County Development Services and County Engineering/Public Works (please forward any portion to the appropriate custodian)

Subject: Request for records and coordinated stormwater/roadside drainage review, 2264 and 2268 Tom Street, Navarre, FL

Dear County Staff:

I am writing as a concerned neighboring homeowner regarding drainage at 2264 and 2268 Tom Street and along the associated Tom Street roadside swale. Our aim is to understand the permitted design and confirm that the completed work safely conveys drainage without creating preventable effects on surrounding homes. We are not alleging that either builder or the County has violated a law or permit.

Saved County records identify **BP-2026-1621** for 2264 Tom Street (parcel **21-2S-26-0780-0QQ00-1020**) and **BP-2026-1612** for 2268 Tom Street (parcel **21-2S-26-0780-0QQ00-1490**). The archived October 2026 MGO records show both permits as Active. Inspector comments reference proposed pipe/inlet work near 2260 and 2270 Tom Street, the roadway stormwater ditch, and matching existing roadway grade. We understand those remarks are not substitute approved plans or proof of what has been installed.

Under Chapter 119, Florida Statutes, I request existing records in their maintained electronic formats, where available, concerning **each** of these permits: applications, approved site and lot grading plans and all revisions, signed/sealed calculations and reviews, existing-conditions and boundary/topographic surveys, proposed/final finished floor and property line elevations, erosion/sediment and construction-phase drainage controls, driveway/culvert details and actual invert/outfall data, inspection and correction records, any required engineer certifications and as-built records, and any certificate-of-occupancy records. Please also identify the engineer and licensed contractor of record.

For the shared roadside system, please provide the design, approved amendments, asset inventory, outfall and invert information, ownership/acceptance and maintenance responsibilities, recorded easements and ROW instruments, and available ditch or culvert maintenance and complaint/inspection history. Please identify whether a subdivision lot grading plan is on file for these lots and any applicable ERP or exemption/alternative determination.

Separately, we request a coordinated field review of the drainage and a written response stating what designs govern, what remains to be built or certified, what conditions the County will evaluate, and who is responsible for follow-up. We recognize that an MGO task labeled **“Certified Drainage as Built: Assigned”** does not itself establish an overdue or missing document.

Please provide an estimate before any substantial service charge, allow rolling production, and identify the statutory ground for any redactions or withheld responsive records. If another department holds a requested record, please identify or forward to that custodian. Kindly acknowledge this request with a tracking reference.

Our concern is the measurable effect of grading and drainage changes, not the mere fact that a new house is higher than an older property. We appreciate your assistance in obtaining the actual engineering record.

Respectfully,

Name: _____ Address: _____ Contact: _____

Status: Draft only. Not submitted or signed. Record transmission and official acknowledgments in the project tracker when they exist.

Tom Street | Proxy meeting notes (reconciled draft)

Opening (read aloud):

I am speaking on behalf of neighboring residents concerned about drainage along Tom Street near the new construction at 2264 and 2268. We are here to request documents and a coordinated engineering review, not to accuse anyone of wrongdoing.

The County's saved permit data identifies **BP-2026-1621 at 2264 Tom Street** and **BP-2026-1612 at 2268 Tom Street**. Both were marked Active when the records were captured. Inspector comments reference roadside drainage, proposed pipe and inlet work near the 2260 and 2270 street addresses, and a direction to match existing roadway grades. We have not obtained the approved plans, surveyed elevations, installed-pipe measurements, or capacity calculations, so those remarks cannot tell us whether drainage is adequate.

Both permit task lists have an item called **Certified Drainage as Built**, marked **Assigned**. That is a normal workflow status in an active permit; it is not proof of an absent or late document or a violation.

Questions to request on the record:

1. Can County Engineering provide the approved grading and drainage plans, with all revisions and calculations, for each lot?
2. Is a subdivision lot-grading plan on file, and what exact approval or alternative applies?
3. What are the actual roadside/driveway pipe and inlet invert elevations, positive outfalls, and maintenance responsibilities?
4. Will County Engineering document a site inspection and review potential changes to runoff reaching nearby existing homes?
5. Who will provide the written response, document index, and follow-up schedule?

Closing:

We are asking for transparent engineering records and a measured answer while work is still under way. Higher fill by itself does not establish a violation, and a passed inspection by itself does not prove the whole drainage system is adequate. We want the facts confirmed and any necessary correction identified by the proper professionals.

If challenged: The records support the questions, not a determination of fault. We have not established flooding causation, negligence, an easement violation, or an unacceptable stormwater design.

Handling instruction: Use the revised homeowner brief. Do not distribute the earlier PDF packet as a final document, and do not show unredacted portal captures or personal photos without permission.

Tom Street | Records status and follow-up (DRAFT)

Date: October 15, 2026. **Administrative status:** Five public-records requests drafted, **no submission receipts verified**. An archive contains 15 internally hash-matched photo copies; their native device originals and capture chronology remain unverified.

Three essential requests for County Engineering

1. Confirm whether an approved subdivision lot grading plan is on file for 2264 and 2268; if not, identify each lot's actual stamped approved grading plan or permit alternative.
2. Provide or arrange the surveyed elevations of swales, driveway/culvert inverts, roadside grade and positive outfall, plus who owns/maintains the shared structures.
3. Identify the engineer of record, the inspection/certification gate before any CO, and the County's process for reviewing drainage impacts on neighboring existing homes.

Meeting follow-up record

- Commissioner / County official attending: _____
- Meeting date and location: _____
- County Engineering contact and department: _____
- County issue / inspection tracking ID: _____
- Approved design files promised and custodian: _____
- Engineering site review request and date: _____
- Records-request sent dates and receipt IDs: _____
- Written response deadline/date offered by County: _____
- Homeowner responsible for follow-up: _____

Critical caution

No code violation, measurable land elevation change, illegal lot division, drainage deficiency or construction-caused flooding has been established. Both building permits showed **Active** on captured MGO records; the assigned drainage-certification task does not establish a filed/missing/overdue document. Photos must remain private unless the owner authorizes disclosure. This is a draft, not legal or engineering advice.
