Tom Street | Proxy meeting notes (reconciled draft)

Opening (read aloud):

I am speaking on behalf of neighboring residents concerned about drainage along Tom Street near the new construction at 2264 and 2268. We are here to request documents and a coordinated engineering review, not to accuse anyone of wrongdoing.

The County's saved permit data identifies **BP-2026-1621 at 2264 Tom Street** and **BP-2026-1612 at 2268 Tom Street**. Both were marked Active when the records were captured. Inspector comments reference roadside drainage, proposed pipe and inlet work near the 2260 and 2270 street addresses, and a direction to match existing roadway grades. We have not obtained the approved plans, surveyed elevations, installed-pipe measurements, or capacity calculations, so those remarks cannot tell us whether drainage is adequate.

Both permit task lists have an item called **Certified Drainage as Built**, marked **Assigned**. The saved task status alone is not proof of an absent or late document or a violation.

Questions to request on the record:

1. Can County Engineering provide the approved grading and drainage plans, with all revisions and calculations, for each lot?
2. Is a subdivision lot-grading plan on file, and what exact approval or alternative applies?
3. What are the roadside/driveway pipe and inlet invert elevations and outfalls? Who maintains Tom Street's road and drainage structures?
4. Will County Engineering document a site inspection and review potential changes to runoff reaching nearby existing homes?
5. Who will provide the written response, document index, and follow-up schedule?

Closing:

We are asking for transparent engineering records and a measured answer while work is still under way. Higher fill by itself does not establish a violation, and a passed inspection by itself does not prove the whole drainage system is adequate. We want the facts confirmed and any necessary correction identified by the proper professionals.

If challenged: The records support the questions, not a determination of fault. We have not established flooding causation, negligence, an easement violation, or an unacceptable stormwater design.

Handling instruction: Use the revised homeowner brief. Do not distribute the earlier PDF packet as a final document, and do not show unredacted portal captures or personal photos without permission.
